

Zephyr

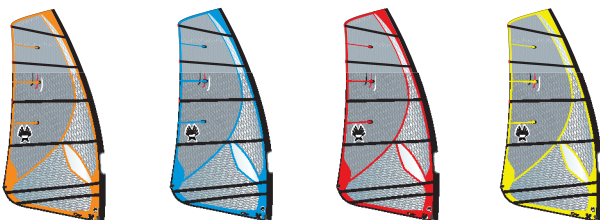

The Zephyr takes us back to our windsurfing roots. Back when you could go out in 10 knots or less of wind and have a really fun time. The idea behind the Zephyr is that you don't need anything bigger than a 7.5 in light air. The boom length is long and the profile is very deep and draft forward, which gives the Zephyr the power of an 8.5.

The Zephyr is light and easy to throw around, and is a blast to sail on the new Stand-Up Paddle (SUP) boards. It also works great on high volume freeride boards too.

The Zephyr has our new seam shaping profile, which produces a camber-like profile without using cams. This gives the Zephyr a very deep and draft forward foil which is what you want for light air sailing. For stronger wind, apply more outhaul to flatten the profile, and the Zephyr becomes a perfect high wind Freeride sail.

The Zephyr is built to last. It contains no monofilm. The lower panels and luff panels are built with our Spectra X Film. The large leech panel is made with a new light weight cloth, which is similar to our Technora® cloth used in our wave sail. The battens are RBS® epoxy. It has a vinyl window for durability and visibility. The Zephyr is built to the same standards as our wave and freeride sails, which means every Zephyr gets rigged and checked before it leaves the factory.

To take the guess work out of rigging, the Zephyr has color coded outhaul and downhaul indicators.

size	min Luff	max Luff	min Boom	max Boom	Mast	No. of Battens	Sail Weight
7.5	485	489	215	226	460	6	4,67 Kg.
